Git and it's terms…. A short Introduction

1. Version Control Software: A software that is used to track and manage changes to your code overtime.

2. Add: This adds a change in the working directory to the staging area. It really means that it tells Git that you want to include a change in a particular file in the next commit/save

3. Commit: Commit is a captured snapshot of your changes in a repository/project that is saved in a safe version for you to view or go back to.

4. Push: This is used when you want to upload your local repository content to a remote one

5. Pull: Pulling something from Git means fetching and downloading content from a repository

6. Clone: Is used to create a copy of an existing repository
